Here is the form of a quadratic trinomial with argument x : $ax^2 + bx + c$. The argument is whatever is being squared. x is being squared. x is called the argument. The argument appears in

the middle term. a , b ,
 c are called
constants. In this
quadratic, $3x^2 + 2x$
 $- 1$, the constants
are 3 , 2 , $- 1$. Now
here is a quadratic
whose argument is x
 3 : $3x^6 + 2x^3 - 1$.

that are factors of the constant term that add up to the middle term. -2 and 1 are these factors. So it factors to: $x^2 = x + 2$
 $\implies (x - 2)(x + 1)$ The other one. $x^2 - 4x = 5 \implies \dots$

Factoring - Trinomials

Objective: Factor

trinomials where the

coefficient of x^2 is

one. Factoring with

three terms, or

trinomials, is the

most important type of factoring to be able to master. As factoring is multiplication backwards we will start with a multiplication problem and look at how we can reverse the process.

terms, factoring each portion of the expression

separately, and then factoring out the GCF of the entire

expression. The

be rewritten as

$(2x + 3)(x + 1)$

using this process.
